

Automation Core Framework

Automation Core is a set of features that allows for automation in security delivery processes throughout WatchGuard's Unified Security Platform® architecture.

COMPREHENSIVE SECURITY

All WatchGuard products are armed with cutting-edge security technologies with consolidated configurations for automated management providing multiple layers of defense, working in tandem as needed to keep user data safe and secure. WatchGuard's product native integrations enhance your security posture with identity and endpoint VPN enforcement, and cross-product detection and response.

OPERATIONAL ALIGNMENT

WatchGuard products seamlessly integrate with your existing systems to automate and simplify operations. With features like RMM, PSA, SIEM integrations, and an API framework, users can easily automate tasks like configuration deployment, compliance reporting, and policy management.

CLARITY & CONTROL

With WatchGuard Cloud, you'll never have to play detective when it comes to essential reports, administration, and workflows management. We have streamlined the process by automating a vast array of management tools that are tailored to your needs. As soon as you activate a device, you'll have access to a treasure trove of information that will help you make informed decisions.

SHARED KNOWLEDGE

ThreatSync simplifies the task of incident and detection correlation from multiple products across the platform, while also facilitating automatic response actions. Aside from increasing efficiency and accuracy, you benefit from verifying known identities and user access patterns to trigger a prompt response whenever necessary, all with the assistance of the XDR solution.
